AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS:

- 1. (Canceled)
- 2. (Canceled)
- 3. (Currently Amended) The male portion according to claim 4 16, wherein the range is 1.2-1.9.
 - 4. (Original) The male portion according to claim 3, wherein the diameter of the cylinder is less than 37 mm.
- 5. (Original) The male portion according to claim 4, wherein the range is 1.3-1.6.
- 6. (Currently Amended) The male portion element according to claim 1 16 fixedly connected to an end of a rod or a tube of steel to form a drill rod having a through-going axial flush channel.
- 7. (Currently Amended) A drill bit for percussive rock drilling having an end portion provided with a central recess having an internal thread for percussive rock drilling provided along a portion of the recess, said recess comprising an abutment surface at an inner end thereof, wherein a length distance L' is defined from the impact abutment surface to a point where an imaginary coaxial circular cylinder ceases to contact a crest of the thread, wherein a quotient of the length L' divided by the diameter Di of the imaginary cylinder lies within the range of 1-2.

- 8. (Original) The drill bit according to claim 7, wherein the range is 1.2-1.9.
- 9. (Currently Amended) The drill bit according to claim 8, wherein the diameter <u>Di</u> of the imaginary cylinder is less than 36 mm.
- 10. (Original) The drill bit according to claim 9, wherein the range is 1.3-1.6.
- 11. (Original) The drill bit according to claim 7, rigidly connected to an end of an rod or a tube of steel to form a drill rod having a through-going axial flush channel.

12. (Canceled)

- 13. (Currently Amended) The threaded joint according to claim 12 17, wherein each of the first and second ranges is 1.2-1.9.
- 14. (Original) The threaded joint according to claim 13, wherein the diameter of each of the first and second cylinders is less than 37 mm.
- 15. (Original) The threaded joint according to claim 14, wherein each of the first and second ranges is 1.3-1.6.
- 16. (New) A male element for percussive rock drilling, the male element having a front end portion on which an external thread for percussive rock drilling is provided; a front end surface of the male element comprising an abutment surface for the transfer of impact waves; said thread including a full profile region of constant first cross-sectional area disposed adjacent a front end of said thread, wherein a length L of the male portion is defined as a length from a plane of the abutment surface to a point where the thread ceases to be at full profile, wherein a quotient of said length L divided by the diameter of the imaginary cylinder, lies within the range

of 1-2; wherein an imaginary cylinder touches the crest of said full profile region, said thread including a last turn whose cross-sectional area gradually increases to be greater than said first cross-sectional area of said full profile region to define a thread exit, said full profile region extending all the way to said last turn.

17. (New) A threaded joint between a male portion and a drill bit for percussive rock drilling, said male portion comprising at least one male thread for percussive rock drilling, an end surface of the male portion comprising a first abutment surface for the transfer of impact waves, said drill bit provided with a central recess comprising an internal female thread for percussive rock drilling provided along a portion of the recess, said recess comprising a second abutment surface at an inner end thereof, wherein a first distance L' is defined from the second abutment surface to a point where a first coaxial circular imaginary cylinder C' ceases to contact a crest of the thread, wherein a quotient of said first distance divided by the diameter of the first cylinder lies with a first range of 1-2; said male thread including a full profile region of constant first cross sectional area disposed adjacent a front end of said male thread, wherein a second imaginary cylinder touches the crest of said full profile region; said male thread including a last turn whose cross-sectional area gradually increases to be greater than said first cross sectional area of said full profile region to define a thread exit; said full profile region extending all the way to said last turn; wherein a length L of the male portion is defined as a length from a plane of the impact surface to a point where the thread ceases to be at full profile, wherein a quotient of said length L divided by a second diameter of the imaginary cylinder, lies within the range of 1-2.
